Forcepoint dlp installation guide 8. 6

Forcepoint dlp installation guide. Forcepoint dlp installation. Forcepoint dlp endpoint installation guide. Forcepoint downloads. Forcepoint protector installation guide.

Installing Forcepoint DLP involves two primary steps: setting up the Management Infrastructure and installing the management components. The Management Infrastructure includes essential elements like the Security Manager, settings database, and reporting database. This is followed by the installation of management components, which comprise a policy engine, crawler, fingerprint repository, forensics repository, and endpoint server. Once the management components are in place, additional Forcepoint DLP servers and components can be installed on various platforms such as servers, appliances, cloud infrastructures, or endpoint client machines. For specific hardware and operating system requirements for Forcepoint DLP components, refer to the System Requirements for this version. Detailed step-by-step installation instructions for both the management server and additional components are provided in the Forcepoint DLP Installation Guide. This guide also covers procedures for adding, modifying, and removing components.
